AMIDES OF AMINOALKYL-SUBSTITUTED AZETIDINES, PYRROLIDINES, PIPERIDINES AND AZEPANES

FIELD OF THE INVENTION

The present invention relates to novel amides of aminoalkyl-substituted azetidines, pyrrolidines, piperidines and azepanes, to the use of these compounds as pharmaceutical compositions, to pharmaceutical compositions comprising the compounds, and to a method of treatment employing these compounds and compositions. The present compounds show a high and selective binding affinity to the histamine H3 receptor indicating histamine H3 receptor antagonistic, inverse agonistic or agonistic activity. As a result, the compounds are useful for the treatment of diseases and disorders related to the histamine H3 receptor.

BACKGROUND OF THE INVENTION

The existence of the histamine H3 receptor has been known for several years and the receptor is of current interest for the development of new medicaments. Recently, the human histamine H3 receptor has been cloned. The histamine H3 receptor is a presynaptic autoreceptor located both in the central and the peripheral nervous system, the skin and in organs such as the lung, the intestine, probably the spleen and the gastrointestinal tract. Recent evidence suggests that the H3 receptor shows intrinsic, constitutive activity, *in vitro* as well as *in vivo* (i.e. it is active in the absence of an agonist). Compounds acting as inverse agonists can inhibit this activity. The histamine H3 receptor has been demonstrated to regulate the release of histamine and also of other neurotransmitters such as serotonin and acetylcholine. A histamine H3 receptor antagonist or inverse agonist would therefore be expected to increase the release of these neurotransmitters in the brain. A histamine H3 receptor agonist, on the contrary, leads to an inhibition of the biosynthesis of histamine and an inhibition of the release of histamine and also of other neurotransmitters such as serotonin and acetylcholine.

These findings suggest that histamine H3 receptor agonists, inverse agonists and antagonists could be important mediators of neuronal activity. Accordingly, the histamine H3 receptor is an important target for new therapeutics.

Compounds similar to the compounds of the present invention have previously been prepared, and their biological properties have been investigated, cf. WO 00/59880, WO 00/39081. However, these references neither disclose nor suggest that these compounds may have a histamine H3 receptor antagonistic or agonistic activity. Several publications disclose the preparation and use of histamine H3 agonists and antagonists. Most of these are imidazole derivatives. However, recently some imidazole-free ligands

of the histamine H3 receptor have been described (see e.g. Linney et al., *J. Med. Chem.* 2000, 43, 2362-2370; US 6,316,475, WO 01/66534 and WO 01/74810). However, these compounds differ structurally from the present compounds.

In view of the art's interest in histamine H3 receptor agonists, inverse agonists and antagonists, novel compounds which interact with the histamine H3 receptor would be a highly desirable contribution to the art. The present invention provides such a contribution to the art being based on the finding that a novel class of amides of aminoalkyl-substituted azetidines,

pyrrolidines, piperidines and azepanes has a high and specific affinity to the histamine H3 receptor.

Due to their interaction with the histamine H3 receptor, the present compounds are useful in the treatment of a wide range of conditions and disorders in which an interaction with the histamine H3 receptor is beneficial. Thus, the compounds may find use e.g. in the treatment of diseases of the central nervous system, the peripheral nervous system, the cardiovascular system, the pulmonary system, the gastrointestinal system and the endocrinological system.

PHARMACEUTICAL COMPOSITIONS

- The compounds of the invention may be administered alone or in combination with pharmaceutically acceptable carriers or excipients, in either single or multiple doses. The pharmaceutical compositions according to the invention may be formulated with pharmaceutically acceptable carriers or diluents as well as any other known adjuvants and excipients in accordance with conventional techniques such as those disclosed in Remington: The Science and Practice of Pharmacy, 19th Edition, Gennaro, Ed., Mack Publishing Co., Easton, PA, 1995.
- The pharmaceutical compositions may be specifically formulated for administration by any suitable route such as the oral, rectal, nasal, pulmonary, topical (including buccal and sublingual), transdermal, intracisternal, intraperitoneal, vaginal and parenteral (including subcutaneous, intramuscular, intrathecal, intravenous and intradermal) route, the oral route being preferred. It will be appreciated that the preferred route will depend on the general condition and age of the subject to be treated, the nature of the condition to be treated and the active ingredient chosen.
- 15 Pharmaceutical compositions for oral administration include solid dosage forms such as capsules, tablets, dragees, pills, lozenges, powders and granules. Where appropriate, they can be prepared with coatings such as enteric coatings or they can be formulated so as to provide controlled release of the active ingredient such as sustained or prolonged release according to methods well known in the art.
- 20 Liquid dosage forms for oral administration include solutions, emulsions, suspensions, syrups and elixirs.
- Pharmaceutical compositions for parenteral administration include sterile aqueous and non-aqueous injectable solutions, dispersions, suspensions or emulsions as well as sterile powders to be reconstituted in sterile injectable solutions or dispersions prior to use. Depot injectable formulations are also contemplated as being within the scope of the present invention.
- 25 Other suitable administration forms include suppositories, sprays, ointments, cremes, gels, inhalants, dermal patches, implants etc.
- A typical oral dosage is in the range of from about 0.001 to about 100 mg/kg body weight per day, preferably from about 0.01 to about 50 mg/kg body weight per day, and more preferred from about 0.05 to about 10 mg/kg body weight per day administered in one or more dosages such as 1 to 3 dosages. The exact dosage will depend upon the frequency and mode of administration, the sex, age, weight and general condition of the subject treated, the nature and severity of the condition treated and any concomitant diseases to be treated and other factors evident to those skilled in the art.

The formulations may conveniently be presented in unit dosage form by methods known to those skilled in the art. A typical unit dosage form for oral administration one or more times per day such as 1 to 3 times per day may contain of from 0.05 to about 1000 mg, preferably from about 0.1 to about 500 mg, and more preferred from about 0.5 mg to about 200 mg.

- 5 For parenteral routes, such as intravenous, intrathecal, intramuscular and similar administration, typically doses are in the order of about half the dose employed for oral administration. The compounds of this invention are generally utilized as the free substance or as a pharmaceutically acceptable salt thereof. One example is an acid addition salt of a compound having the utility of a free base. When a compound of the formula (I) contains a free base such salts are prepared in a conventional manner by treating a solution or suspension of a free base of the formula (I) with a chemical equivalent of a pharmaceutically acceptable acid, for example, inorganic and organic acids. Representative examples are mentioned above. Physiologically acceptable salts of a compound with a hydroxy group include the anion of said compound in combination with a suitable cation such as sodium or ammonium ion.
- 10 15 For parenteral administration, solutions of the novel compounds of the formula (I) in sterile aqueous solution, aqueous propylene glycol or sesame or peanut oil may be employed. Such aqueous solutions should be suitable buffered if necessary and the liquid diluent first rendered isotonic with sufficient saline or glucose. The aqueous solutions are particularly suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The 20 sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art.
- Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solution and various organic solvents. Examples of solid carriers are lactose, terra alba, sucrose, cyclodextrin, talc, gelatine, agar, pectin, acacia, magnesium stearate, stearic acid or lower 25 alkyl ethers of cellulose. Examples of liquid carriers are syrup, peanut oil, olive oil, phospholipids, fatty acids, fatty acid amines, polyoxyethylene or water. Similarly, the carrier or diluent may include any sustained release material known in the art, such as glyceryl monostearate or glyceryl distearate, alone or mixed with a wax. The pharmaceutical compositions formed by combining the novel compounds of the formula (I) and the pharmaceutically acceptable 30 carriers are then readily administered in a variety of dosage forms suitable for the disclosed routes of administration. The formulations may conveniently be presented in unit dosage form by methods known in the art of pharmacy.
- Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules or tablets, each containing a predetermined amount of the active ingredient, and which may include a suitable excipient. These formulations may be in 35

the form of powder or granules, as a solution or suspension in an aqueous or non-aqueous liquid, or as an oil-in-water or water-in-oil liquid emulsion.

If a solid carrier is used for oral administration, the preparation may be tabletted, placed in a hard gelatine capsule in powder or pellet form or it can be in the form of a troche or lozenge.

- 5 The amount of solid carrier will vary widely but will usually be from about 25 mg to about 1 g.
If a liquid carrier is used, the preparation may be in the form of a syrup, emulsion, soft gelatine capsule or sterile injectable liquid such as an aqueous or non-aqueous liquid suspension or solution.

A typical tablet, which may be prepared by conventional tabletting techniques, may contain:

General procedure (A)

The compounds of formula (I) according to the invention may be prepared by the general procedure (A):

Step A:

The compounds of the general formula (I) are prepared from an *N*-protected amino alcohol of the general formula (II). The protective group may be chosen from the protective groups known in the art and described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc., New York, 1991). The amino alcohol of the general formula (II) is oxidized by a suitable method known in the art, e.g. using oxalyl chloride and dimethylsulphoxide or dicyclohexylcarbodiimide and dimethylsulphoxide to yield an aldehyde of the general formula (III).

Step B:

- 10 The aldehyde of the general formula (III) is reacted with an amine of the general formula (IV) under acidic or neutral conditions with a reduction reagent such as e.g. sodium acetoxyborohydride or sodium cyanoborohydride to give an amine of the general formula (V).

Step C:

- 15 The protective group is removed by a method known in the art and described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991) to give an amine of the general formula (VI) either as free base or as a salt.

Step D:

- 20 The amine of the general formula (VI) - either as a free base or as a salt – is reacted with an acid of formula (VII) and a coupling reagent such as e.g. a combination of 1-hydroxy-7-azabenzotriazole and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride salt or a combination of 3-hydroxy-1,2,3-benzotriazin-4(3H)-one and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride salt, optionally in the presence of an amine base such as e.g. triethylamine or ethyldiisopropylamine, or with an activated derivative of the acid of the
25 formula (VII) such as e.g. an acid chloride, acid imidazolide or a phenolic ester to give a compound of the general formula (I).

General procedure (B)

The compounds of formula (I) according to the invention may also be prepared by the general procedure (B):

**Step A:**

The compounds of the general formula (I) are synthesized from a *N*-protected amino acid of the general formula (VIII). The protective group may be chosen from the protective groups known in the art and described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective

10 groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991).

An amine of the general formula (IV) - either as a free base or as a salt - is reacted with a *N*-protected amino acid of the general formula (VIII) and a coupling reagent such as e.g. a combination of 1-hydroxy-7-azabenzotriazole and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride salt or a combination of 3-hydroxy-1,2,3-benzotriazin-4(3*H*)-one and 1-

(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride salt, optionally in the presence of an amine base such as e.g. triethylamine or ethyldiisopropylamine, or an activated derivative of the acid of the general formula (VIII) such as e.g. an acid chloride, acid imidazolide or a phenolic ester to give an amide of the general formula (IX).

5. Step B:

The amide (IX) is reduced with an appropriate reduction reagent such as e.g. borane, a combination of sodium borohydride and iodine or a combination of sodium borohydride and sulfuric acid to give an amine of the general formula (V).

Step C and Step D:

- 10 These steps are identical to steps C and D of general procedure (A).

General Procedure (C)

5

Step A

This step is identical to step A of general procedure (B),

Step B

10

The protection group of the amine is removed by a method known in the art (e.g. T. W. Greene, P. G. Wuts, *Protective groups in organic synthesis*, 2nd edition, John Wiley & Sons

Inc. New York, 1991) to give an amide of the general formula (X) either as free base or as a salt.

Step C:

- 5 The amide (X) is reduced with an appropriate reduction reagent such as e.g. lithium aluminum hydride, yielding an amine of the general formula (VI).

Step D:

This step is identical to step D of general procedure (A).

General Procedure (D)

5

Step A

A metalation directing group DG (e.g. a 2-tetrahydropyranyl group) is attached to a phenol of type (XI) as known for a person trained in the art or described in the literature (e.g. T. W.

Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991) to give a compound of type (XII)

Step B

- 5 The compound of type (XII) is treated with an alkylmetal reagent such as *n*-butyllithium sec.-butyllithium or *tert*-butyllithium with or without a chelating reagent such as *N,N,N',N'*-tetramethylethylenediamine at appropriate temperature such as a temperature between -78°C and room temperature for an appropriate time (5 min-16 h). A suitable electrophile such as *N,N*-dimethylformamide is added. The directing group is either removed during work up or during a step using a method known for a person trained in the art or described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991) to give an aldehyde of type (XIII).
- 10

Step C:

- 15 The aldehyde of type (XIII) is reacted with a suitable 2-haloester such as e.g. diethyl bromomalonate in the presence of an appropriate base such as potassium carbonate in an appropriate solvent such as ethyl methyl ketone at an appropriate temperature (e.g. between 0°C and 200°C) to give the ester of type (XIV).

20

Step D:

- The ester of type (XIV) is saponified with a method known for a person trained in the art or described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991), e.g. potassium hydroxide in methanol or lithium hydroxide in a mixture of dioxane and water to give an acid of type (XV).
- 25

Step E:

This step is identical to step D of general procedure (A).

30

General Procedure (E)

5

Step A

A suitable halogenarene such as a bromine or iodine compound of the general structure (XVI) is reacted with an alkyl acrylate of the general structure (XVII) in the presence of a

- 10 suitable catalyst such as e.g. a palladium catalyst such as e.g. palladium(II) acetate in the presence of a suitable ligand such as triphenylphosphine and a suitable base such as e.g. an amine-base such as e.g. triethylamine or ethyldiisopropylamine, to yield an alkyl acrylate of the general structure (XVIII).

- 15 **Step B**

The ester of type (XVIII) is saponified with a method known for a person trained in the art or described in the literature (e.g. T. W. Greene, P. G. Wuts, Protective groups in organic synthesis, 2nd edition, John Wiley & Sons Inc. New York, 1991), e.g. potassium hydroxide in methanol or lithium hydroxide in a mixture of dioxane and water to give an acid of type (XIX).

5

Step C:

This step is identical to step D of general procedure (A) yielding a compound of the general structure (Ib).

20 Step A: (S)-2-Formylpyrrolidine-1-carboxylic acid *tert*-butyl ester

At -78 °C, a solution of dimethylsulphoxide (7.06 ml, 0.099 mol) in dichloromethane (10 ml) was added dropwise to a solution of oxalyl chloride (6.40 ml, 0.075 mol) in dichloromethane

(15 ml). The reaction mixture was stirred for 20 min at -78 °C. A solution of (S)-1-(*tert*-butoxycarbonyl)-2-pyrrolidinemethanol (10 g, 0.050 mol) in dichloromethane (50 ml) was added. The reaction mixture was stirred for 20 min at -78 °C. Triethylamine (27.7 ml, 0.199 mol) was added. The reaction mixture was stirred for 10 min at -78 °C and then warmed to 5 room temperature. It was washed with a 10% aqueous solution of sodium hydrogen sulphate (60 ml). The aqueous phase was extracted with dichloromethane (30 ml). The combined organic layers were washed with a saturated aqueous solution of sodium hydrogen carbonate (100 ml) and dried over magnesium sulphate. The solvent was removed *in vacuo*, to give 10 11.2 g of crude (S)-2-formylpyrrolidine-1-carboxylic acid *tert*-butyl ester, which was used for the next step without purification.

¹H NMR (CDCl₃, 2 sets of signals) δ 1.50 (m, 9 H); 1.75-2.20 (m, 4 H); 3.20-4.00 (m, 3 H); 4.05 and 4.20 (both t, together 1 H); 9.50 and 9.60 (both s, together 1 H).

13.4 g of (E)-3-(4-(trifluoromethylsulfonyloxy)phenyl)acrylic acid was synthesized as described for (E)-3-(4-(methanesulfonyloxy)phenyl)acrylic acid using trifluoromethansulfonic acid anhydride methanesulfonyl chloride.

10

¹H-NMR (DMSO-d₆) δ 6.60 (d, 1 H); 7.55 (d, 2 H); 7.65 (d, 1 H); 7.90 (d, 2 H).

Step 2:

15

130 mg of the title compound were synthesized as described for (E)-3-(4-bromophenyl)-1-((S)-2-((pyrrolidin-1-yl)methyl)pyrrolidin-1-yl)propanone, using (E)-3-(4-(trifluoromethylsulfonyloxy)phenyl)acrylic acid instead of (E)-4-bromocinnamic acid.

20

¹H-NMR (CDCl₃, 2 sets of signals) δ 1.75 (m, 4 H); 1.85-2.15 (m, 4 H); 2.40-2.80 (m, 5 H); 3.55-3.75 (m, 2 H); 4.15 and 4.40 (both m, together 1 H); 6.70 and 6.90 (both d, together 1 H); 7.30 (d, 2 H); 7.60 (d, 2 H); 7.65 (d, 1 H).

HPLC method A: elution at 9.97 min.

25

MS: calc. for [M+H]⁺: 433; found: 433.

The title compound was transferred into its hydrochloride salt, by dissolving it in ethyl acetate (5 ml). A 3.2 M solution of hydrogen chloride in ethyl acetate (5 ml) was added. The solvent was removed *in vacuo*. The residue was dissolved in ethanol (50 ml). The solvent was removed *in vacuo*.

3-[(*E*)-3-Oxo-3-((*S*)-2-((pyrrolidin-1-yl)methyl)pyrrolidin-1-yl)propenyl]benzonitrile

10

Step 1:

(*E*)-3-(3-Cyanophenyl)acrylic acid

15

11.3 g of (*E*)-3-(3-cyanophenyl)acrylic acid were synthesized as described for (*E*)-3-(4-methanesulfonyloxy)phenyl)acrylic acid, using 3-cyanobenzaldehyde (commercially available at Aldrich) instead of methanesulfonic acid 4-formylphenyl ester.

20 ¹H-NMR (DMSO-d₆) δ 6.70 (d, 1 H); 7.60 (m, 2 H); 7.85 (d, 1 H); 8.05 (d, 1 H); 8.25 (s, 1 H); 12.50 (br, 1 H).

Step 2:

25 220 mg of the title compound were synthesized as described for (*E*)-3-(4-bromophenyl)-1-((*S*)-2-((pyrrolidin-1-yl)methyl)pyrrolidin-1-yl)propanone, using (*E*)-3-(3-cyanophenyl)acrylic acid instead of (*E*)-4-bromocinnamic acid.

¹H-NMR (as trifluoroacetic acid salt, CDCl₃) δ 1.90 (m, 1 H); 2.00-2.30 (m, 7 H); 3.05-3.20 (m, 2 H); 3.25 (m, 1 H); 3.65 (m, 1 H); 3.70-3.90 (m, 3 H); 4.15 (m, 1 H); 4.50 (m, 1 H); 6.75 (d, 1 H); 7.55 (t, 1 H); 7.65 (d, 1 H); 7.70 (d, 1 H); 7.75 (d, 1 H); 7.85 (s, 1 H).

5 HPLC method A: elution at 7.37 min.

MS: calc. for [M+H]⁺: 310; found: 310.

10 The title compound was transferred into its hydrochloride salt, by dissolving it in ethyl acetate (5 ml). A 3.2 M solution of hydrogen chloride in ethyl acetate (5 ml) was added. The solvent was removed *in vacuo*. The residue was dissolved in ethanol (50 ml). The solvent was removed *in vacuo*.

Example 47(General procedure (A))

15

(*E*)-1-((S)-2-((Piperidin-1-yl)methyl)pyrrolidin-1-yl)-3-(3-trifluoromethylphenyl)propenone

The ability of the compounds to interact with the histamine H3 receptor can be determined by the following *in vitro* binding assays.

20 **Binding assay I**

Rat cerebral cortex is homogenized in ice cold K-Hepes, 5 mM MgCl₂ pH 7.1 buffer. After two differential centrifugations the last pellet is resuspended in fresh Hepes buffer containing 1 mg/ml bacitracin. Aliquots of the membrane suspension (400 µg/ml) are incubated for 60 min at 25°C with 30 pM [¹²⁵I]-iodoproxifan, a known histamine H3 receptor antagonist, and the test compound at various concentrations. The incubation is stopped by dilution with ice-cold medium, followed by rapid filtration through Whatman GF/B filters pretreated for 1 hour with 0.5% polyethyleneimine. The radioactivity retained on the filters is counted using a Cobra II auto gamma counter. The radioactivity of the filters is indirectly proportional to the binding affinity of the tested compound. The results are analyzed by nonlinear regression analysis.

25 **Binding assay II**

The H3-receptor agonist ligand R- α -methyl[³H]histamine (RAMHA) is incubated with isolated rat cortex cell-membranes at 25 °C for 1 hour, followed by a filtration of the incubate through Whatman GF/B filters. Radioactivity retained on the filters is measured using a beta counter.

Male Wistar rats (150-200 g) are decapitated and cerebral cortex is quickly dissected out and frozen immediately on dry ice. Tissue is kept at -80 °C until membrane preparation. During the membrane preparation the tissue is kept on ice all the time. Rat cerebral cortex is homogenized in 10 volumes (w/w) ice-cold Hepes buffer (20 mM Hepes, 5 mM MgCl₂ pH 7.1

- 5 (KOH) + 1 mg/ml bacitracin) using an Ultra-Turrax homogenizer for 30 seconds. The homogenate is centrifuged at 140 g in 10 min. The supernatant is transferred to a new test tube and centrifuged for 30 min at 23 000 g. Pellet is resuspended in 5-10 ml Hepes buffer, homogenized and centrifuged for 10 min at 23 000 g. This short centrifugation step is repeated twice. After the last centrifugation the pellet is resuspended in 2-4 ml Hepes buffer and the
- 10 protein concentration is determined. The membranes are diluted to a protein concentration of 5 mg/ml using Hepes buffer, aliquoted and stored at -80 °C until use.

- 50 µl test-compound, 100 µl membrane (200 µg/ml), 300 µl Hepes buffer and 50 µl R-α-methyl[³H]histamine (1 nM) are mixed in a test tube. The compounds to be tested are dissolved in DMSO and further diluted in H₂O to the desired concentrations. Radioligand and
15 membranes are diluted in Hepes buffer + 1 mg/ml bacitracin. The mixture is incubated for 60 min at 25 °C. Incubation is terminated by adding 5 ml ice-cold 0.9% NaCl, followed by rapid filtration through Whatman GF/B filters pre-treated for 1hour with 0.5% polyethyleneimine. The filters are washed with 2 x 5 ml ice-cold NaCl. To each filter a 3 ml scintillation cocktail is added and the radioactivity retained is measured with a Packard Tri-Carb beta counter.
20 IC₅₀ values are calculated by non-linear regression analysis of binding curves (6 points minimum) using the windows program GraphPad Prism, GraphPad software, USA.

Binding assay III

- The human H3 receptor is cloned by PCR and subcloned into the pcDNA3 expression vector. Cells stably expressing the H3 receptor are generated by transfecting the H3-expression vectors into HEK 293 cells and using G418 to select for H3 clones. The human H3-HEK 293 clones are cultured in DMEM (GIBCO-BRL) with glutamax, 10% foetal calf serum, 1% penicillin/streptavidin and 1 mg/ml G 418 at 37 °C and 5% CO₂. Before harvesting, the confluent cells are rinsed with PBS and incubated with Versene (proteinase, GIBCO-BRL) for approximately 5 min. The cells are flushed with PBS and DMEM and the cell suspension collected in
25 a tube and centrifuged for 5-10 min at 1500 rpm in a Heraeus Sepatech Megafuge 1.0. The pellet is resuspended in 10-20 vol. Hepes buffer (20 mM Hepes, 5 mM MgCl₂, pH 7.1 (KOH)) and homogenized for 10-20 seconds using an Ultra-Turrax homogenizer. The homogenate is centrifuged for 30 min at 23 000 g. The pellet is resuspended in 5-10 ml Hepes buffer, homogenized 5-10 seconds with the Ultra-Turrax and centrifuged for 10 min at 23 000 g. Fol-

lowing this centrifugation step, the membrane pellet is resuspended in 2-4 ml Hepes buffer, homogenized with a syringe or Teflon homogenizer, and the protein concentration determined. The membranes are diluted to a protein concentration of 1-5 mg/ml in Hepes buffer, aliquoted and kept at -80 °C until use.

- 5 Aliquots of the membrane suspension are incubated for 60 min at 25 °C with 30 pM [¹²⁵I]-iodoproxifan, a known compound with high affinity for the H3 receptor, and the test compound at various concentrations. The incubation is stopped by dilution with ice-cold medium, followed by rapid filtration through Whatman GF/B filters pretreated for 1 hour with 0.5% polyethyleneimine. The radioactivity retained on the filters is counted using a Cobra II auto
10 gamma counter. The radioactivity of the filters is indirectly proportional to the binding affinity of the tested compound. The results are analysed by nonlinear regression analysis.
When tested, the present compounds of the formula (I) generally show a high binding affinity to the histamine H3 receptor.
Preferably, the compounds according to the invention have an IC₅₀ value as determined by
15 one or more of the assays of less than 10 µM, more preferred of less than 1 µM, and even more preferred of less than 500 nM, such as of less than 100 nM.

Functional assay I

- The ability of the compounds to interact with the histamine H3 receptor as agonists, inverse agonists and/or antagonists, is determined by an *in vitro* functional assay utilizing membranes from HEK 293 cell expressing the human H3 receptors.
20

The H3 receptor is cloned by PCR and subcloned into the pcDNA3 expression vector. Cells stably expressing the H3 receptor are generated by transfecting the H3-expression vectors into HEK 293 cells and using G418 to select for H3 clones. The human H3-HEK 293 clones are cultured in DMEM with glutamax, 10% foetal calf serum, 1% penicillin/streptavidin and 1
25 mg/ml G 418 at 37 °C and 5% CO₂.

The H3 receptor expressing cells are washed once with phosphate buffered saline (PBS) and harvested using versene (GIBCO-BRL). PBS is added and the cells are centrifuged for 5 min at 188 g. The cell pellet is resuspended in stimulation buffer to a concentration of 1 x 10⁶ cells/ml. cAMP accumulation is measured using the Flash Plate® cAMP assay (NEN™ Life
30 Science Products). The assay is generally performed as described by the manufacturer.

Briefly, 50 µl cell suspension is added to each well of the Flashplate which also contained 25 µl 40 µM isoprenaline, to stimulate cAMP generation, and 25 µl of test compound (either agonists or inverse agonists alone, or agonist and antagonist in combination). The assay can be run in "agonist-mode" which means that the test compound is added, in increasing con-

centration, on its own, to the cells, and cAMP is measured. If cAMP goes up, it is an inverse agonist; if cAMP does not change, it is a neutral antagonist, and if cAMP goes down, it is an agonist. The assay can also be run in the "antagonist-mode" which means that a test compound is added, in increasing concentrations, together with increasing concentrations of a known H3 agonist (e.g. RAMHA). If the compound is an antagonist, increasing concentrations of it cause a right-ward shift in the H3-agonist's dose-response curves. The final volume in each well is 100 µl. Test compounds are dissolved in DMSO and diluted in H₂O. The mixture is shaken for 5 min, and allowed to stand for 25 min at room temperature. The reaction is stopped with 100 µl "Detection Mix" per well. The plates are then sealed with plastic, shaken for 30 min, allowed to stand overnight, and finally the radioactivity is counted in the Cobra II auto gamma topcounter. EC₅₀ values are calculated by non-linear regression analysis of dose response curves (6 points minimum) using GraphPad Prism. Kb values are calculated by Schild plot analysis.

Functional assay II

The ability of the compounds to bind and interact with the human H3 receptor as agonists, inverse agonists and/or antagonists, is determined by a functional assay, named [³⁵S] GTPγS assay. The assay measures the activation of G proteins by catalyzing the exchange of guanosine 5'-diphosphate (GDP) by guanosine 5'-triphosphate (GTP) at the α-subunit. The GTP-bounded G proteins dissociate into two subunits, Gα_{GTP} and Gβγ, which in turn regulate intracellular enzymes and ion channels. GTP is rapidly hydrolysed by the Gα-subunit (GTPases) and the G protein is deactivated and ready for a new GTP exchange cycle. To study the function of ligand induced G protein coupled receptor (GPCR) activation by an increase in guanine nucleotide exchange at the G proteins, the binding of [³⁵S]-guanosine-5'-O-(3-thio) triphosphate [³⁵S] GTPγS, a non-hydrolysed analogue of GTP, is determined. This process can be monitored *in vitro* by incubating cell membranes containing the G protein coupled receptor H3 with GDP and [³⁵S] GTPγS. Cell membranes are obtained from CHO cells stably expressing the human H3 receptor. The cells are washed twice in PBS, harvested with PBS+1 mM EDTA, pH 7.4 and centrifuged at 1000 rpm for 5 min. The cell pellet is homogenized in 10 ml ice-cold Hepes buffer (20 mM Hepes, 10 mM EDTA pH 7.4 (NaOH)) using an Ultra-Turrax homogenizer for 30 seconds and centrifuged for 15 min at 20.000 rpm. Following this centrifugation step, the membrane pellet is resuspended in 10 ml ice-cold Hepes buffer (20 mM Hepes, 0.1 mM EDTA pH 7.4 (NaOH)) and homogenized as described above. This procedure is repeated twice except for the last homogenization step, the protein

concentration is determined and membranes are diluted to a protein concentration at 2 mg/ml, aliquoted and kept at -80 °C until use.

In order to study the presence and the potency of an inverse agonist/antagonist the H3-receptor agonist ligand R- α -methyl histamine (RAMHA) is added. The ability of the test com-

5 pound to counteract the effect of RAMHA is measured. When studying the effect of an ago-
nist RAMHA is not added to the assay medium. The test compound is diluted in the assay
buffer (20 mM HEPES, 120 mM NaCl, 10 mM MgCl₂ pH 7.4 (NaOH)) at various concentra-
tions followed by addition of 10⁻⁸ nM RAMHA (only in the case where an inverse ago-
nist/antagonist is examined), 3 μ M GDP, 2.5 μ g membranes, 0.5 mg SPA beads and 0.1 nM
10 [³⁵S] GTP γ S and incubated for 2 hours by slightly shaking at room temperature. The plates
are centrifuged at 1500 rpm for 10 min and the radioactivity is measured using a Top-
counter. The results are analyzed by non linear regression and the IC₅₀ value is determined.
RAMHA and other H3 agonists stimulate the binding of [³⁵S] GTP γ S to membranes express-
ing the H3 receptor. In the antagonist/inverse agonist test, the ability of increasing amounts
15 of test compound to inhibit the increased [³⁵S] GTP γ S binding by 10⁻⁸ M RAMHA is measured
as a decrease in radioactivity signal. The IC₅₀ value determined for an antagonist is the ability
of this compound to inhibit the effect of 10⁻⁸ M RAMHA by 50%. In the agonist test, the ability
of increasing amounts of test compound is measured as an increase in radioactivity signal.
The EC₅₀ value determined for an agonist, is the ability of this compound to increase the sig-
20 nal by 50% of the maximal signal that is obtained by 10⁻⁵ M RAMHA.

Preferably, the antagonists and agonists according to the invention have an IC₅₀/EC₅₀ value
as determined by one or more of the assays of less than 10 μ M, more preferred of less than
1 μ M, and even more preferred of less than 500 nM, such as of less than 100 nM.

The open cage Schedule-fed rat model

25 The ability of the present compounds to reduce weight is determined using the *in vivo* open
cage Schedule-fed rat model.
Sprague-Dawley (SD) male rats of an age of about 1½ to 2 months and a weight of about
30 200-250 g are purchased from Møllegård Breeding and Research Centre A/S (Denmark). On
arrival they are allowed some days of acclimatisation before being placed in individual open
plastic cages. They are habituated to the presence of food (Altromin pelleted rat chow) in
their home cage only during 7 hours in the morning from 07.30 to 14.30 all days a week. Wa-
ter is present ad libitum. As the consumption of food has stabilised after 7 to 9 days, the ani-
mals are ready for use.

Each animal is used only once to avoid carry-over effects between treatments. During the test sessions, the test compound is administered intraperitoneally or orally 30 min before the start of the sessions. One group of animals is administered the test compound at different doses and a control group of animals is given a vehicle. Food and water intake are monitored
5 at 1, 2 and 3 hours post administration.

Any side effects may rapidly be discovered (barrel-rolling, bushy fur etc.) since the animals are kept in transparent plastic cages to enable continuous monitoring.

INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: 46-47 because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. Claims Nos.: 30-32, 36, 42-43, 46-47 because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.1

Claims Nos.: 46-47

Claims 46-47 relate to methods of treatment of the human or animal body by surgery or by therapy/diagnostic methods practised on the human or animal body/Rule. 39.1.(iv). Nevertheless, a search has been executed for these claims. The search has been based on the alleged effects of the compounds/compositions.

Continuation of Box I.2

Claims Nos.: 30-32,36,42-43,46-47

The expressions "disorders and diseases related to the histamine H3 receptor" (claims 30 and 46), "diseases and disorders in which an inhibition of the H3 histamine receptor has a beneficial effect" (claim 31), "disorders and diseases related to overweight and obesity" (claim 36) and "diseases and disorders in which a stimulation of the H3 histamine receptor has a beneficial effect" (claim 42) may relate to a number of different disorders and conditions which are not clearly defined by these expressions. Likewise does the expressions "pharmaceutical composition having histamine H3 antagonistic activity" (claim 32) and "pharmaceutical composition having histamine H3 agonistic activity" (claim 43) not define the use of the compounds in satisfactory way. The pharmaceutical use of a compound should be defined in terms of actual diseases or conditions and not by reference to an underlying mechanism. Hence the claims can not be considered to be clear and concise within the meaning of Article 6 PCT and a meaningful search of the claims 30-32, 36, 42-43 and 46-47 can not be performed.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
